Visualizing and Predicting Heart Diseases with an Interactive Dash Board

Team ID: PNT2022TMID23536

Faculty Mentor: Team Leader: B.Ashwin

R.Kalaimathi Team Member : R.Narayana Moorthi

Team Member: M.GokulaKrishnan

Team Member: J.Gokula Krishna

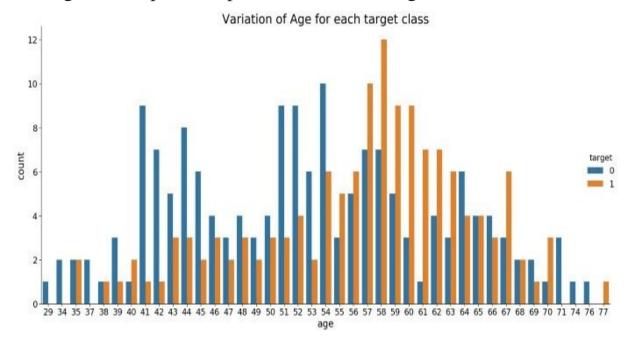

Project Objectives:

1.	Age: displays the age of the individual.								
2.	Sex: displays to 1 0 = female	he gender	of the	individual =	using the	following	format :		
3.	Chest-pain type: displays the type of chest-pain experienced by the individual								
	using	the		following		format			
	1	=		ty	pical		angina		
	2 =			atypical			angina		
	3 =		non		aı	nginal	pair		
	4 = asymptotic								
	Resting Blood Pressure: displays the resting blood pressure value of an individual in mmHg (unit)Serum Cholestrol: displays the serum cholesterol in mg/dl (unit)								
6.	Fasting Blood Sugar: compares the fasting blood sugar value of an individual with								
	If fasting else: 0 (false)	blood	sugar	> 120n	ng/dl the	en :	1 (true)		
7.	Resting EC	G : dis	plays	resting =	electrocar	diographic	results norma		
	1 = 2 = left ventricu	havii lar hyperth	U	ST-T	wave	e a	bnormality		
8.	Max heart rate individual.	achieved	: display	s the max	heart rate a	achieved by	an an		

9. Exercise		induced		angina :					
1		=		yes					
0 = no									
10. ST depression induced by exercise relative to rest: displays the value which is an integer or float.									
11. Peak	exercise		ST	segment:					
1		=		upsloping					
2		=		flat					
3 = downsloping									
12. Number of major vessels (0–3) colored by flourosopy: displays the value as integer or float.									
13. Thal :	displays	the	thalassemia	a :					
3		=		normal					
6	=		fixed	defect					
7 = reversible de	efect								
14. <i>Diagnosis of heart disease</i> : Displays whether the individual is suffering from									
heart	disease	or	not	:					
0		=		absence					
1, 2, 3, 4 = prese	nt.								
-									

Data Analysis

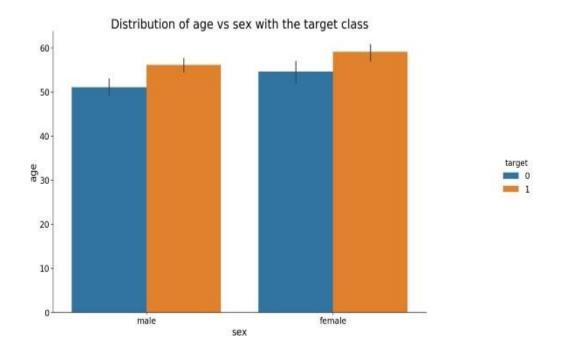

Let us look at the people's age who are suffering from the disease or not. Here, target = 1 implies that the person is suffering from heart disease and target = 0 implies the person is not suffering.

We see that most people who are suffering are of the age of 58, followed by 57.

Majorly, people belonging to the age group 50+ are suffering from the disease.

Next, let us look at the distribution of age and gender for each target class.

We see that for females who are suffering from the disease are older than males.

Data Pre-Processing

The dataset contains 14 columns and 303 rows. Let us check the null values

Out[2]: 0 age 0 sex 0 ср trestbps chol 0 fbs 0 restecg thalach 0 0 exang oldpeak slope 0 4 ca thal 2 target 0 dtype: int64

null values in each column of the data

We see that there are only 6 cells with null values with 4 belonging to attribute ca and 2 to thal.

As the null values are very less we can either drop them or impute them. I have imputed the mean in place of the null values however one can also delete these rows entirely.

Now let us divide the data in the test and train set. In this project, I have divided the data into an 80: 20 ratio. That is, the training size is 80% and testing size is 20% of the whole data.
